

Introducing FOAMPOD, the new foam storage system

Together with her client base in the petro-chemical industry and in close co-operation with her Australian partners FFT has developed the FOAMPOD.

The first 4 FOAMPODS have recently been delivered to an Australian client.

The FOAMPODs above are made from HDPE (cross linked high density polyethylene) which is compliant with the foam. These FOAMPODs store 13,000 litres of foam and can be used for large scale firefighting. The advantages: light, no rust, low maintenance, a durable solid and basic design.

FOAMPODs are available in different designs and colours, as pods for hook lift trucks, on skids for cranes, on trailers, in HDPE or SS as well as different sizes, all depending on the need of the client. A foam pumps or foam proportioner can be added as required.
