

From where they live below sea level:

## The BoxBarrier

Rain, overflowing rivers and the North Sea represent a serious flood threat. Amsterdam Airport is 3m below sea level and Amsterdam 1m below. Flood barriers have to be reliable; the stakes are high and have been for more than 1000 years.

The BoxBarrier was developed in The Netherlands and proves to be a major success. Simplicity, ease of storage and ease of deployment with sand or water are main drivers of its success.

For flood water heights up to 500mm. Can be stacked for higher water heights. Any length is possible.

Also available as a standby facility: 20ft container containing 180m BoxBarrier including pump. Rental options for a flood season or construction work.
