

**You will understand this flood barrier in 30 seconds.**

Okay, this is a one-off explanation only as we've received too many questions not to address the topic. The FloodBreak automatic flood barrier works:

- Without electricity - No Power
- Without people pushing buttons, flexing their muscles or even being present - No People
- Without hydraulic pumps - No Pumps.

Why is this relevant?

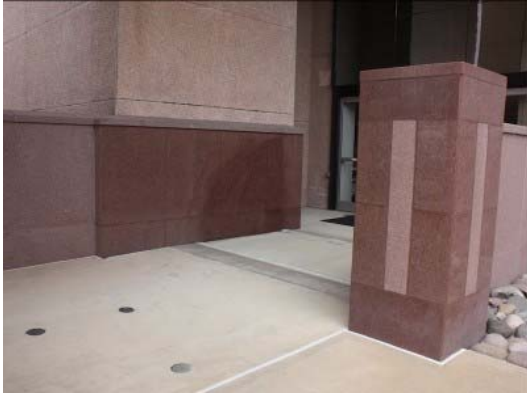

Because all of the above can fail during a flood emergency, which affects reliability.

This barrier simply floats up when the floodwaters arrive and goes down when the flood waters recede.

Works 24/7.

Any size, any height. That's all.
