

## NOAQ Gable

The NOAQ Gable is a complement or extension to the NOAQ Boxwall. It offers a length flexibility to a boxwall, but it can also be used to let a boxwall pass a small vertical drop like a step or a kerb.

Two gables are connected as shown below, transposed vertically to fit the height difference of the kerb. A boxwall from each direction is put on top of the horizontal parts of the gables, resting against the vertical parts.
