

AQUAFENCE FACTS:

- Tested by the US Army Corps of Engineers
- Designed to become more stable as the water rises
- Proven in major floods in the US, Europe and Thailand
- Less than 4 hours to install 300 meters of AquaFence with 12 workers
- High-grade, waterproof materials
- Re-usable, dozens of times
- Virtually maintenance free system
- Immediate installation without any expensive foundation piling
- No fill material needed.

BLUEMONT
FLOOD

NEVER AGAIN

AquaFence

**The most advanced
flood control system**

TESTED BY THE US ARMY CORPS OF ENGINEERS

- The AquaFence system was recently tested by the United States Army Corps of Engineers at their National Engineering Research and Development Center in Vicksburg, Mississippi.
- After 7 weeks of rigorous tests AquaFence out-performed all flood control systems previously tested. Why? AquaFence units are designed to become more stable as water levels rise.

AQUAFENCE IS READY EVEN BEFORE YOU NEED IT

- AquaFence units are stored in crates in your warehouse, and can be immediately deployed by forklift or truck.
- The site installation can be done by local workers with minimal training.
- You do not need any costly and time-consuming ground treatment such as piling. Just put AquaFence on the ground and you are ready to go.
- Your location will be pre-inspected by AquaFence staff to maximize the units' effectiveness.

EVENT AFTER EVENT, THE MOST COST-EFFECTIVE FLOOD PROTECTION ON THE MARKET

- AquaFence units can be used and re-used. After each use you clean your units and return them to your storage, ready for your next call. Cost is amortized over multiple deployments. You will never need to invest in one-time use sand bags and Big Bags again.
- AquaFence is a modular and mobile system, allowing you to adapt and deploy your flood protection for multiple situations.
- And remember, AquaFence is a "green" system which does not contaminate the environment.
